NEWER CORONARY RISK ASSESSMENTS

Coronary artery disease (CAD) is the number one killer in the U.S. It is also a major cause of disability. In recent years new tests and tools have been developed to hopefully identify those individuals who are at high risk of developing CAD and its many complications. Carotid intima-media thickness, ankle-brachial index, high-sensitivity C-reactive protein, coronary calcium scores are just some of the tests that have been suggested in recent years to improve the diagnosis, assessment and risk of CAD.

If you would like copies of any of these articles, or if you would like further information on this or any topic, please contact any Library team member.
