FOODBORNE DISEASES

CDC estimates that each year roughly 1 in 6 people in the U.S. (or 48 million people) becomes sick, 128,000 are hospitalized and 3,000 die of foodborne diseases. The top five pathogens contributing to domestically acquired foodborne illnesses and causing the most illnesses, hospitalizations and deaths each year are Norovirus, Salmonella, Clostridium perfringens, Campylobacter spp. and Staphylococcus aureus.
