## Rochester General Hospital Edition

JUNE 2009

### A New Influenza Virus

Novel Influenza A (H1N1) of swine origin is a new flu virus that was first detected in April, 2009. It appears that the virus is spreading from person to person and cases are confirmed in the US and several other countries. Because this is a new virus and most people do not have immunity to it, this virus may potentially be more serious and pose a greater healthcare concern. At this time however, it's difficult to predict how serious or widespread this new virus will be. For the most current information go to CDC's <http://www.cdc.gov/h1n1flu/>. If you would like copies of any of these articles, or if you would like further information on this topic, please contact any library staff member.
